

# Tagging Software Services with “Web 2.0” Style Tags

- Objectives:
  - To explain how simple use of BML concepts are similar to “Tagging” as used in the so called “Web 2.0”. However the focus of the DBE software services and not content (text, audio, video, etc)!!
  - To show the Usage of the “Duplicate” (0..N) (1..N) functionality in BMLData Editor and BML Concepts

After we “tag” the services, we can search for them using simple queries, for example:

*“software Tag/Type=one Tag/Type=two”*

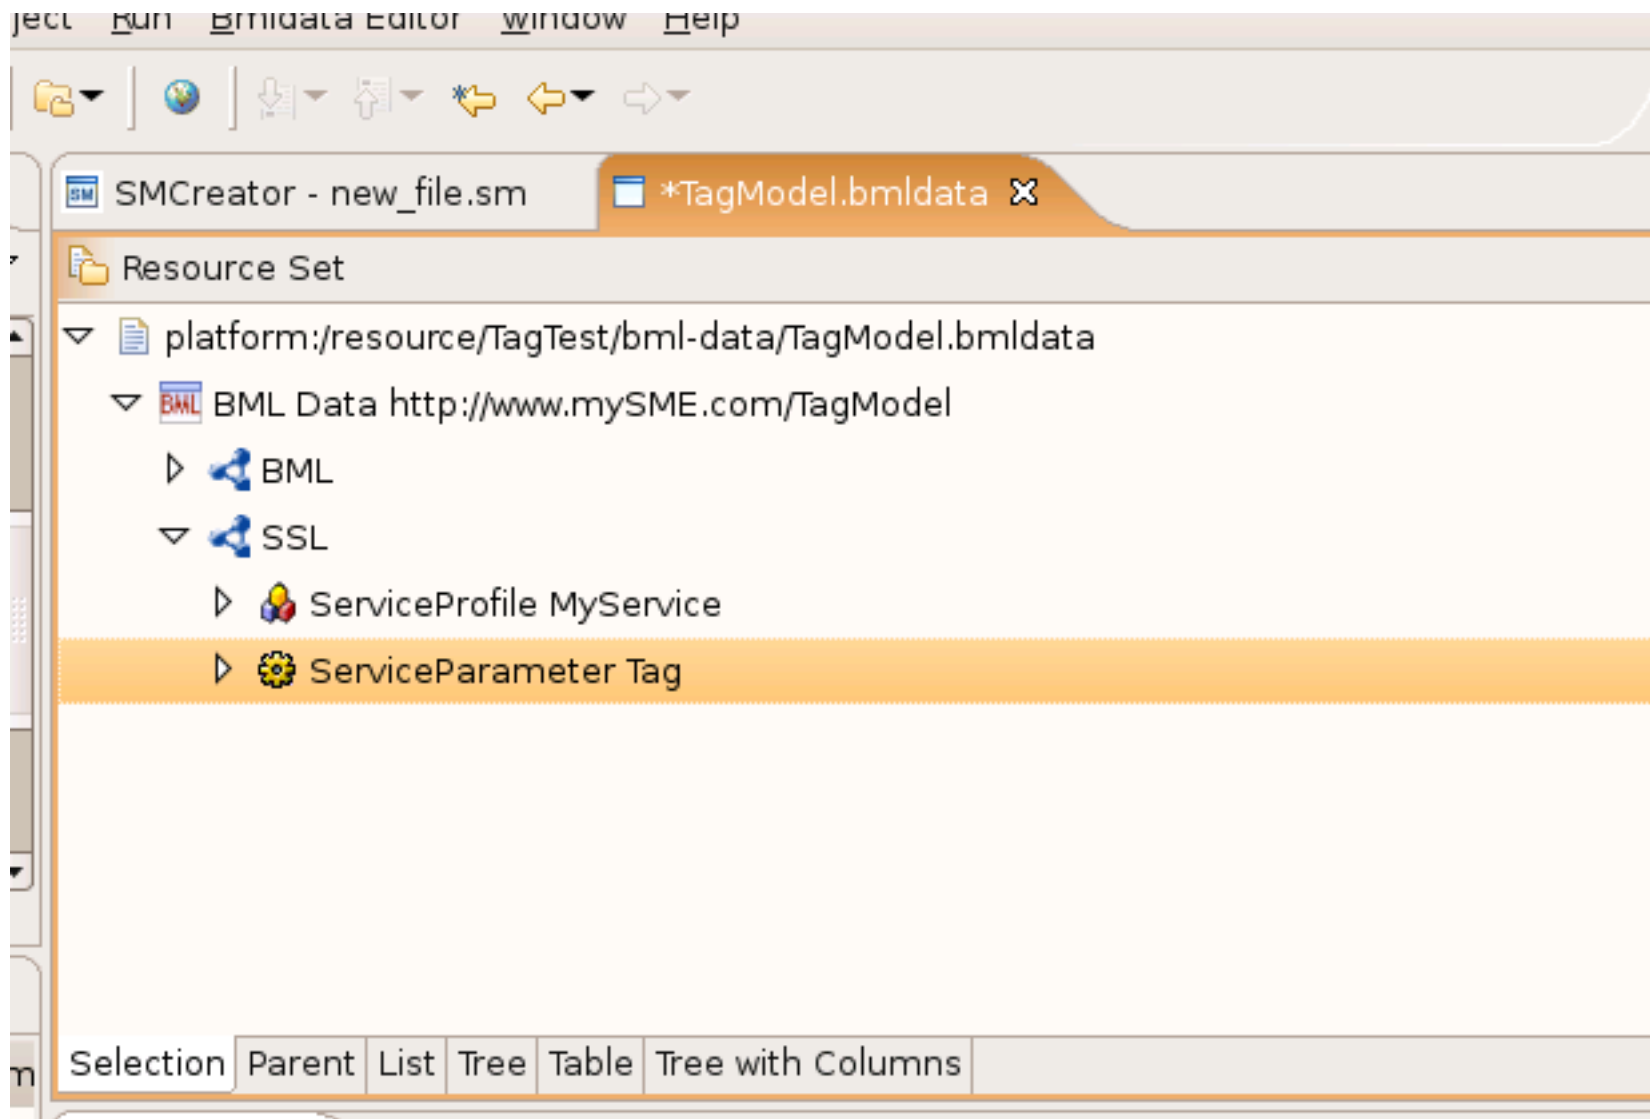

The screenshot displays the DBE Business Analysis application window. The main workspace shows a Semantic Description diagram with two classes: `<<Service Profile>> MyService` and `<<Service Parameter>> Tag`. `MyService` has a property `domain: string`. `Tag` has a property `type: string`. A relationship labeled "relation" connects them with a cardinality of 1 to 0..1.

The Property View for the selected `Tag` class is shown below:

Properties	Description
Service Parameter's Description	
General	
Profile	MyService
Name	Tag

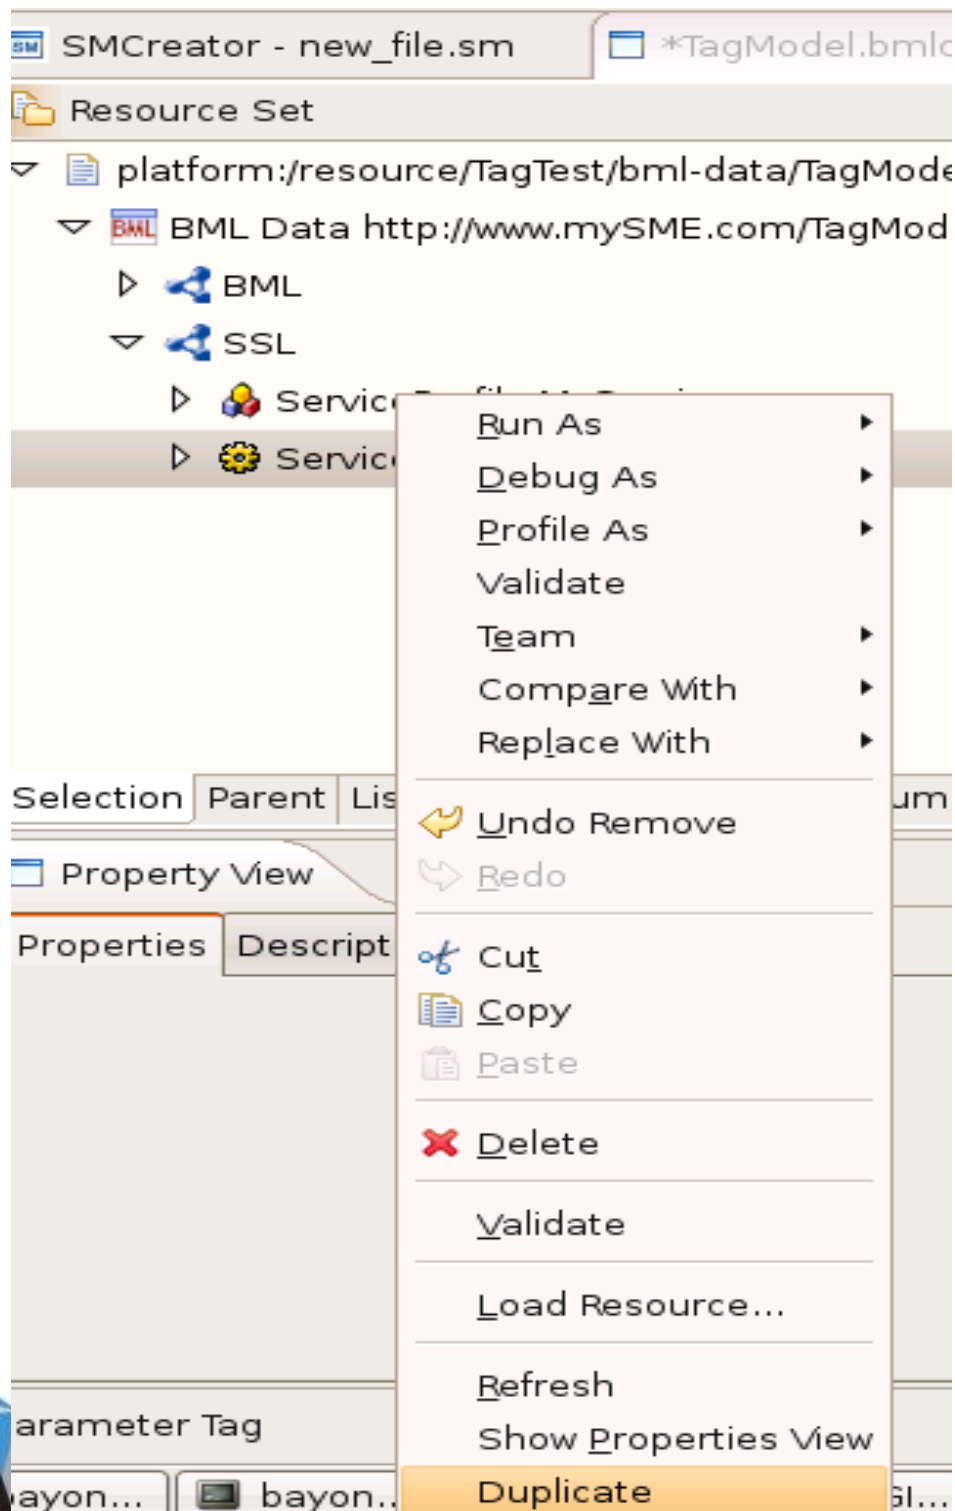

Very simple BML model, with a *ServiceParameter* “Tag” and Type as String\*.

\*ServiceParameters can only contain one Attribute, which is named by default “Type”. The name cannot be changed

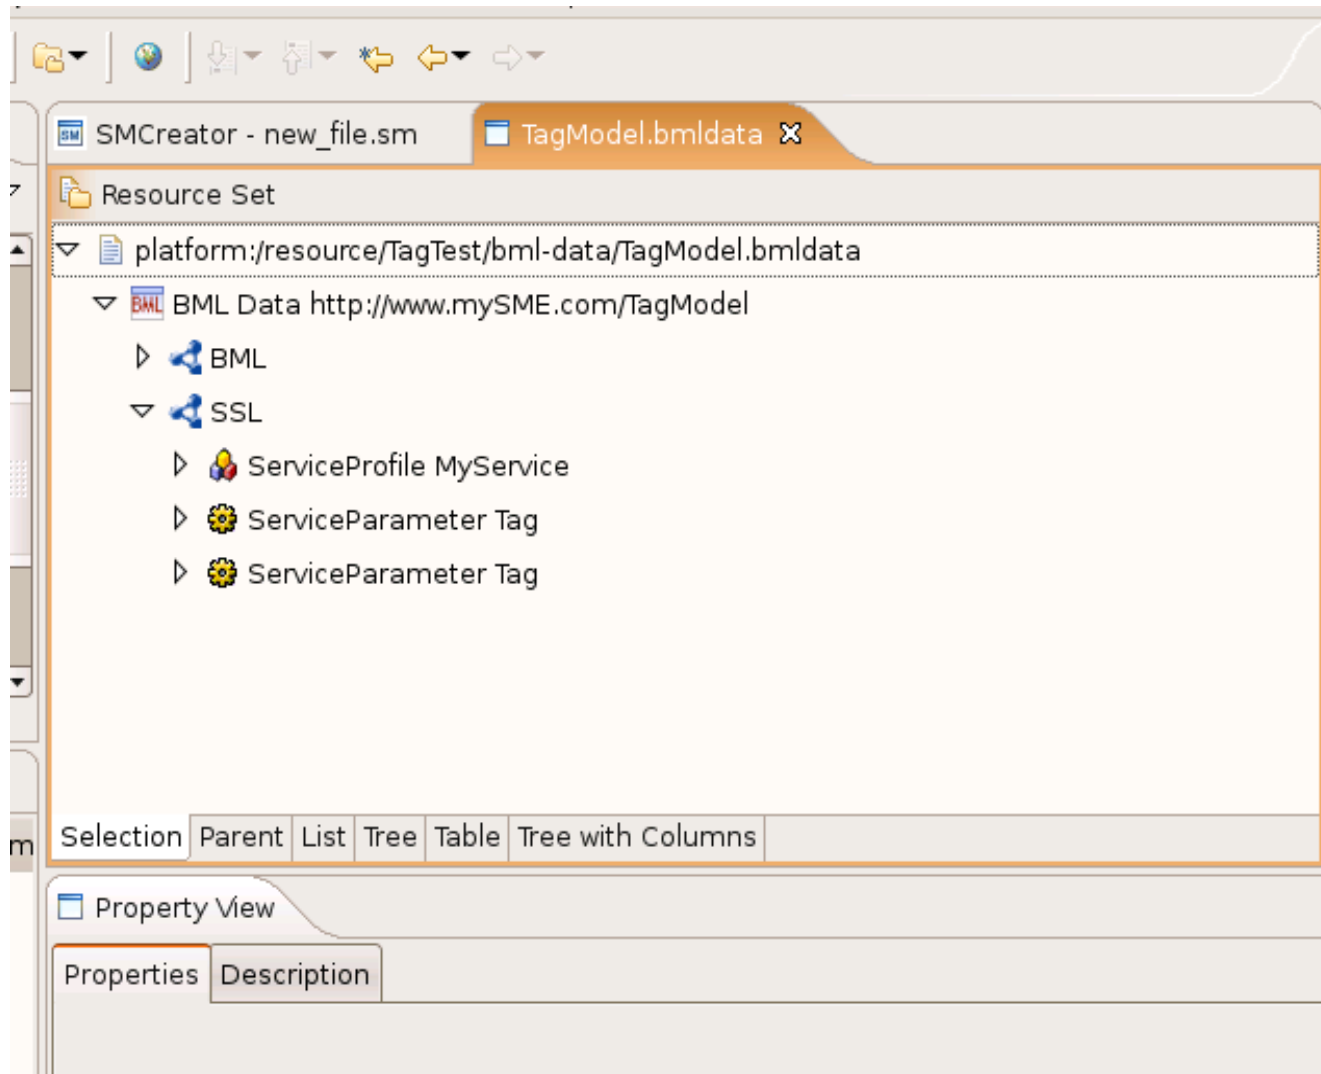

The BMLData M0 Model, showing the ServiceParameter “Tag” of the SSL Part

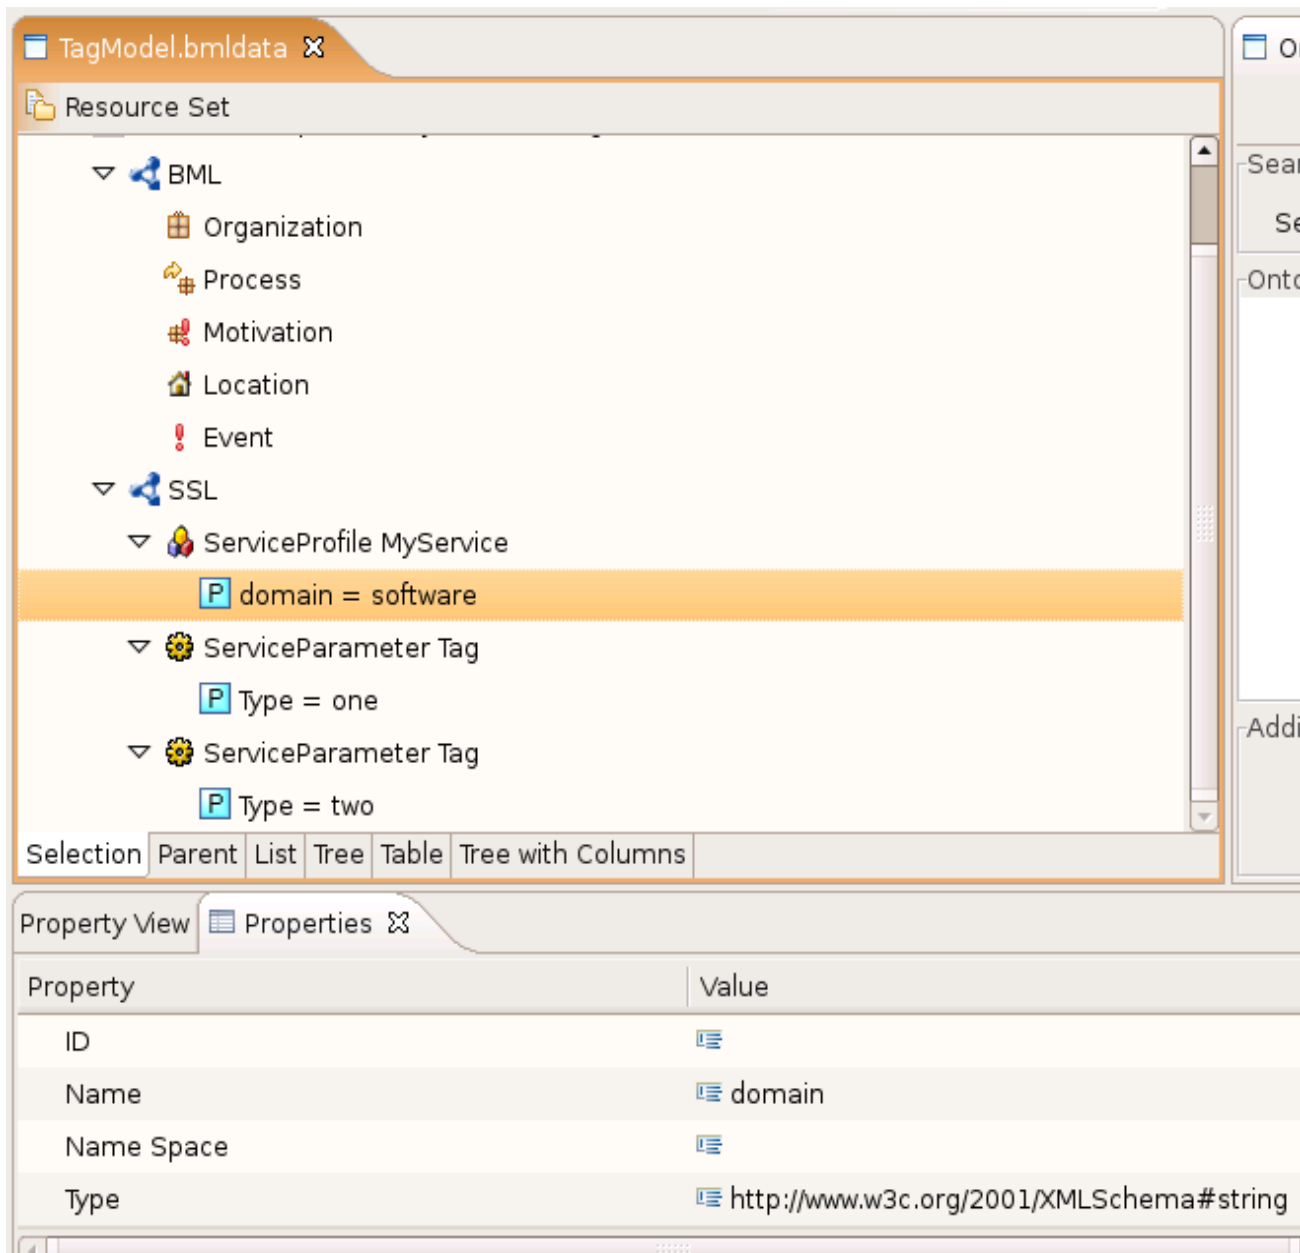

Right Click (or equivalent) will open up the context menu, where we can select “Duplicate” to create a new “ServiceParameter” concept.

You could use also the Standard commands such as “Copy/Paste” and or “Delete” to remove unwanted concepts

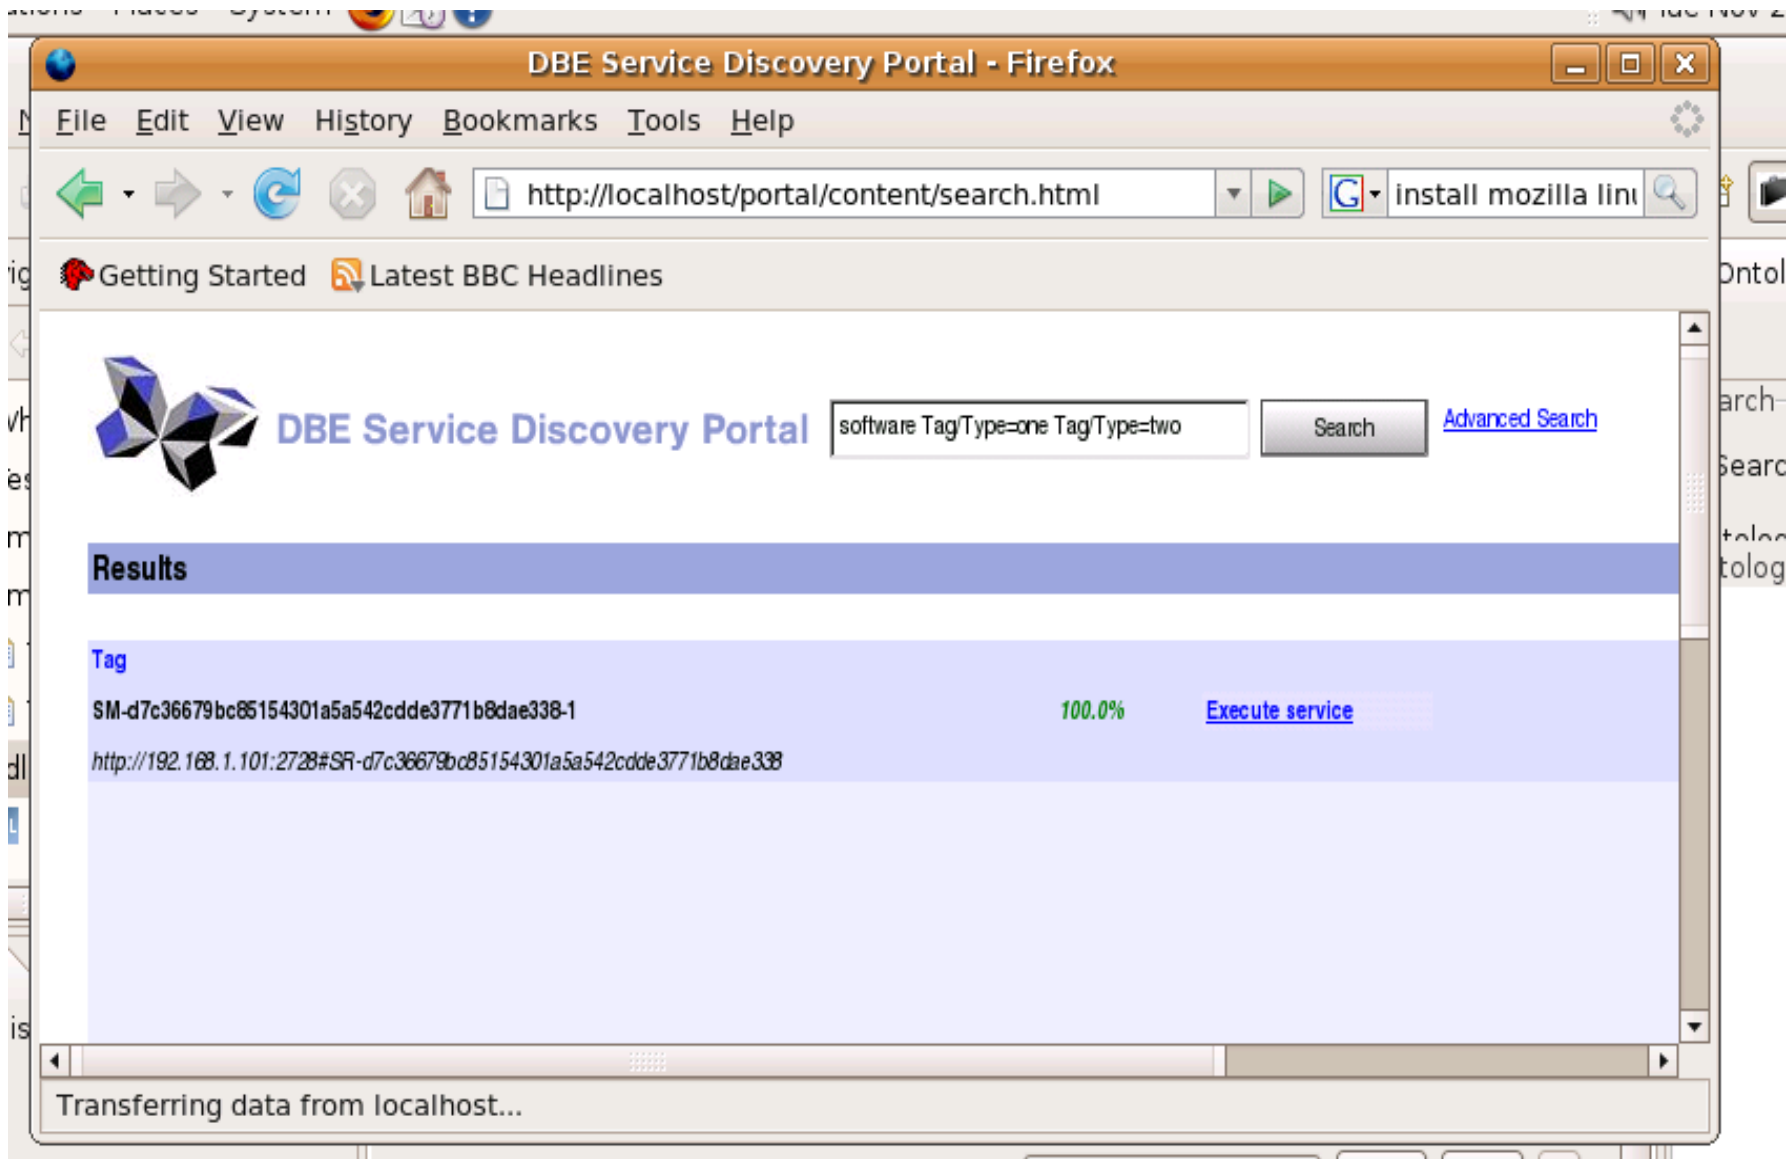

The BMLData M0 Model, showing the 2 ServiceParameter “Tag” newly created

The BMLData M0 Model, With the service data (i.e. *Type=one* in first *ServiceParameter* and *Type=two* in second *ServiceParameter*)

After the SM is deployed, we can then search for services using the Tagging mechanism

# Notes

- The purpose of this presentation is to show how to use basic BML to support a simple Tagging mechanism, and the BMLData editor “Duplicate” functionality
- The models and modelling is arbitrary, and does not represent the full potential of BML, such as the use of ontologies, or more complex models
